

What we think about electricity as energy...

- Matt – It turns stuff on and it goes.
- Brady – it runs through cords and stuff
- Cali – There is electricity in your body. It runs through your nerves and I think that is what makes you run.
- Jackson V. – Sticking your finger in an electrical outlet is not a good idea
- Mason – If like lightening wasn't really strong, you could put your cell phone outside and it would charge it.
- Charties – When you plug in something it charges it up. If you put it in a dead plug it won't charge it at all.
- Dan – It can produce heat.
- Malachi – if you put your finger in an electrical outlet your hair can stand up.
- Caitlin – If you're on a trampoline, your hair goes up because of static electricity.
- Tanner – never go near metal poles while it's storming. Caitlin says that it goes straight through.
- Amber – if you put a balloon on your head it will make your hair go wild. Ayana says static.
- Mason – never go near water whenever it's lightening, because the electricity from lightening goes through the water.
- Dan – It can control video games or motion sensors.
- Jackson V – as long as it has a screen and you stick a magnet next to it, it will screw it up.
- Cali - Sometimes electricity won't work.
- Tanner – a metal pole in the sand and dig it up, it will make glass, because the heat makes it stick together.
- Caitlin – If you touch a power line and touch the ground it will electrocute you , and this is why birds can sit on the line.
